TITLE: Laundry detergent or cleaning product tablets with partial coating

----- KWIC -----

The thickness of the coating varies depending on the composition of the coating and on the nature of the substances used as coating materials. Certain film-forming polymers may bring about mechanical protection with considerably lower coat thicknesses than, for example, coating materials such as solidified salt melts, etc. Independently of the abovementioned parameters, preference is given to laundry detergent or cleaning product tablets of the invention wherein the thickness of the coating is from 0.1 to 3000  $\mu\text{m}$ , preferably from 0.5 to 500  $\mu\text{m}$ , and in particular from 5 to 250  $\mu\text{m}$ .
